

Projects

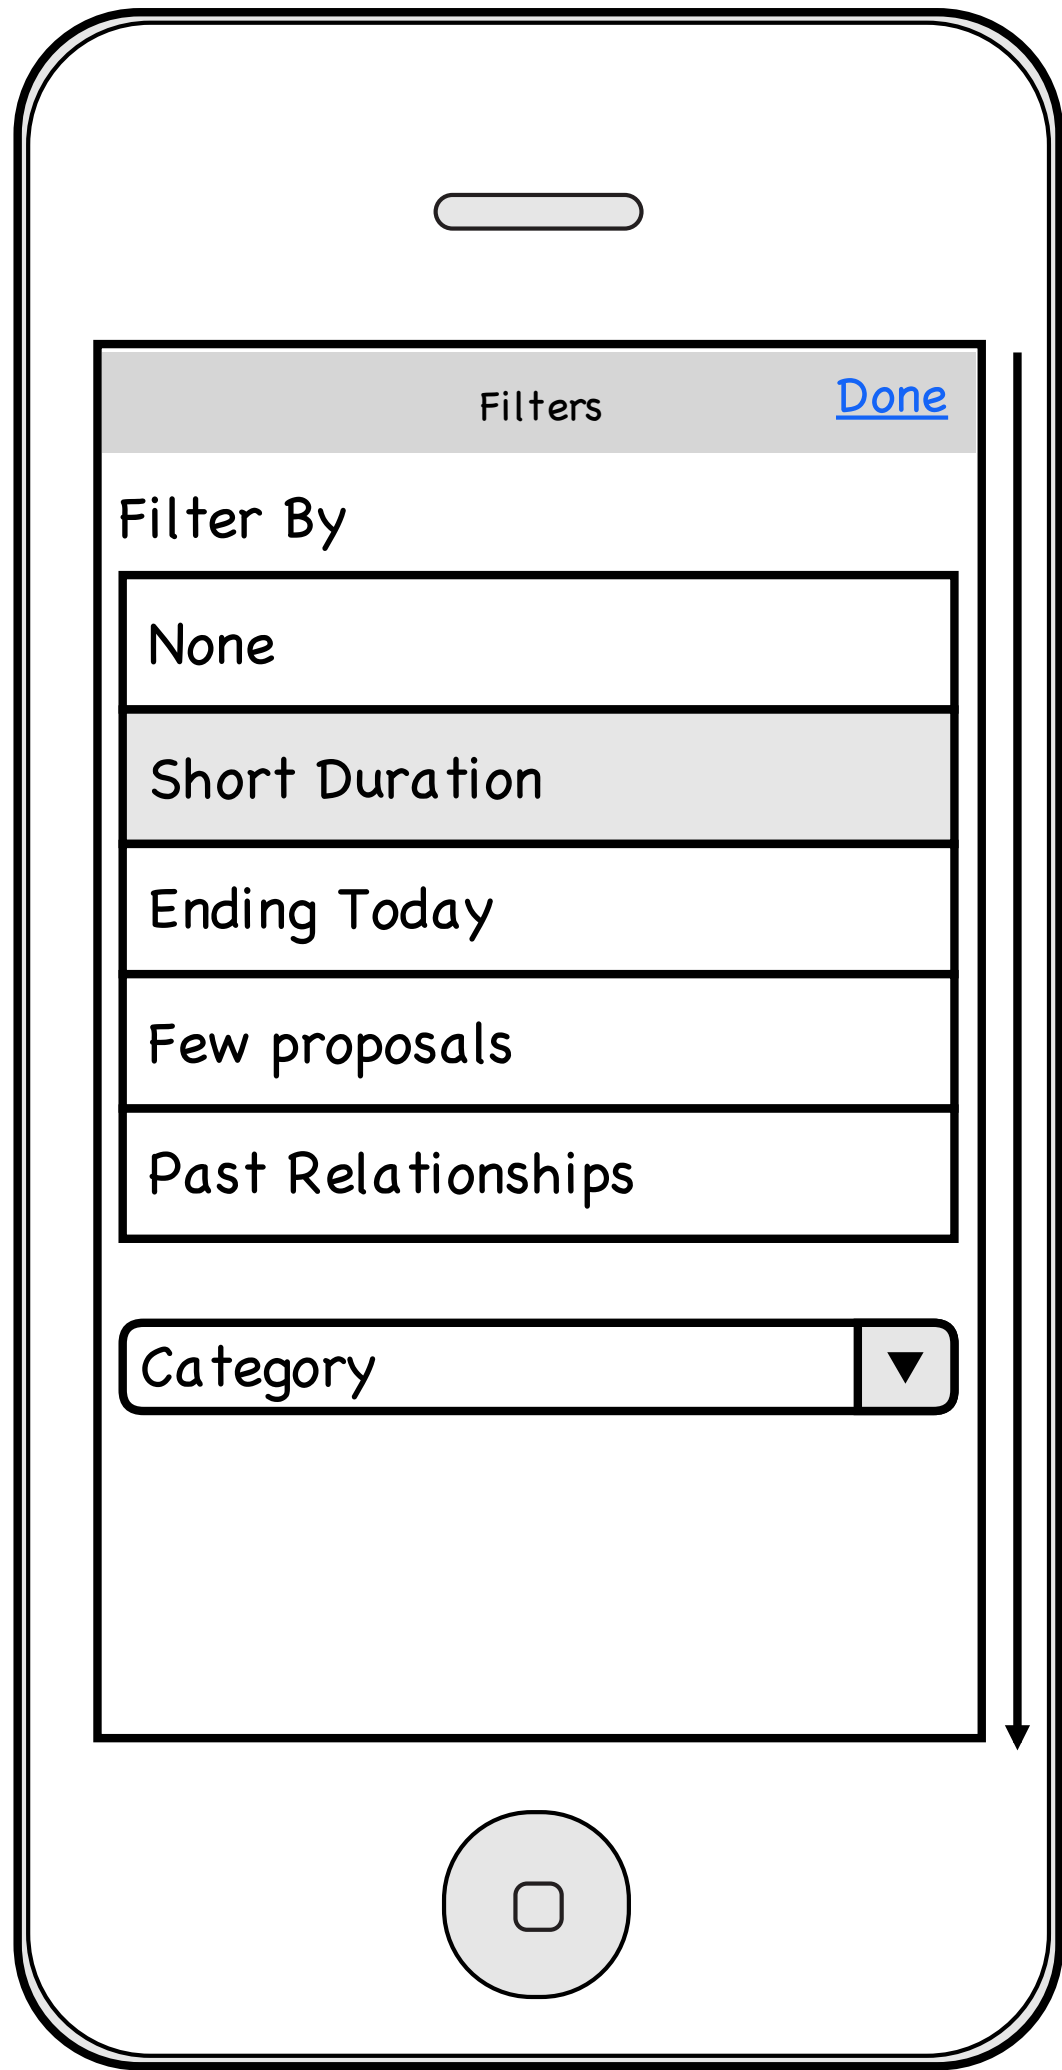

Search for projects or choose one of the predefined sections. Once a user starts typing in the search field the rest of the screen goes blank while completing their search.

When clicking the predefined sections the user is taken to that particular project list which would follow the model in the following screens.

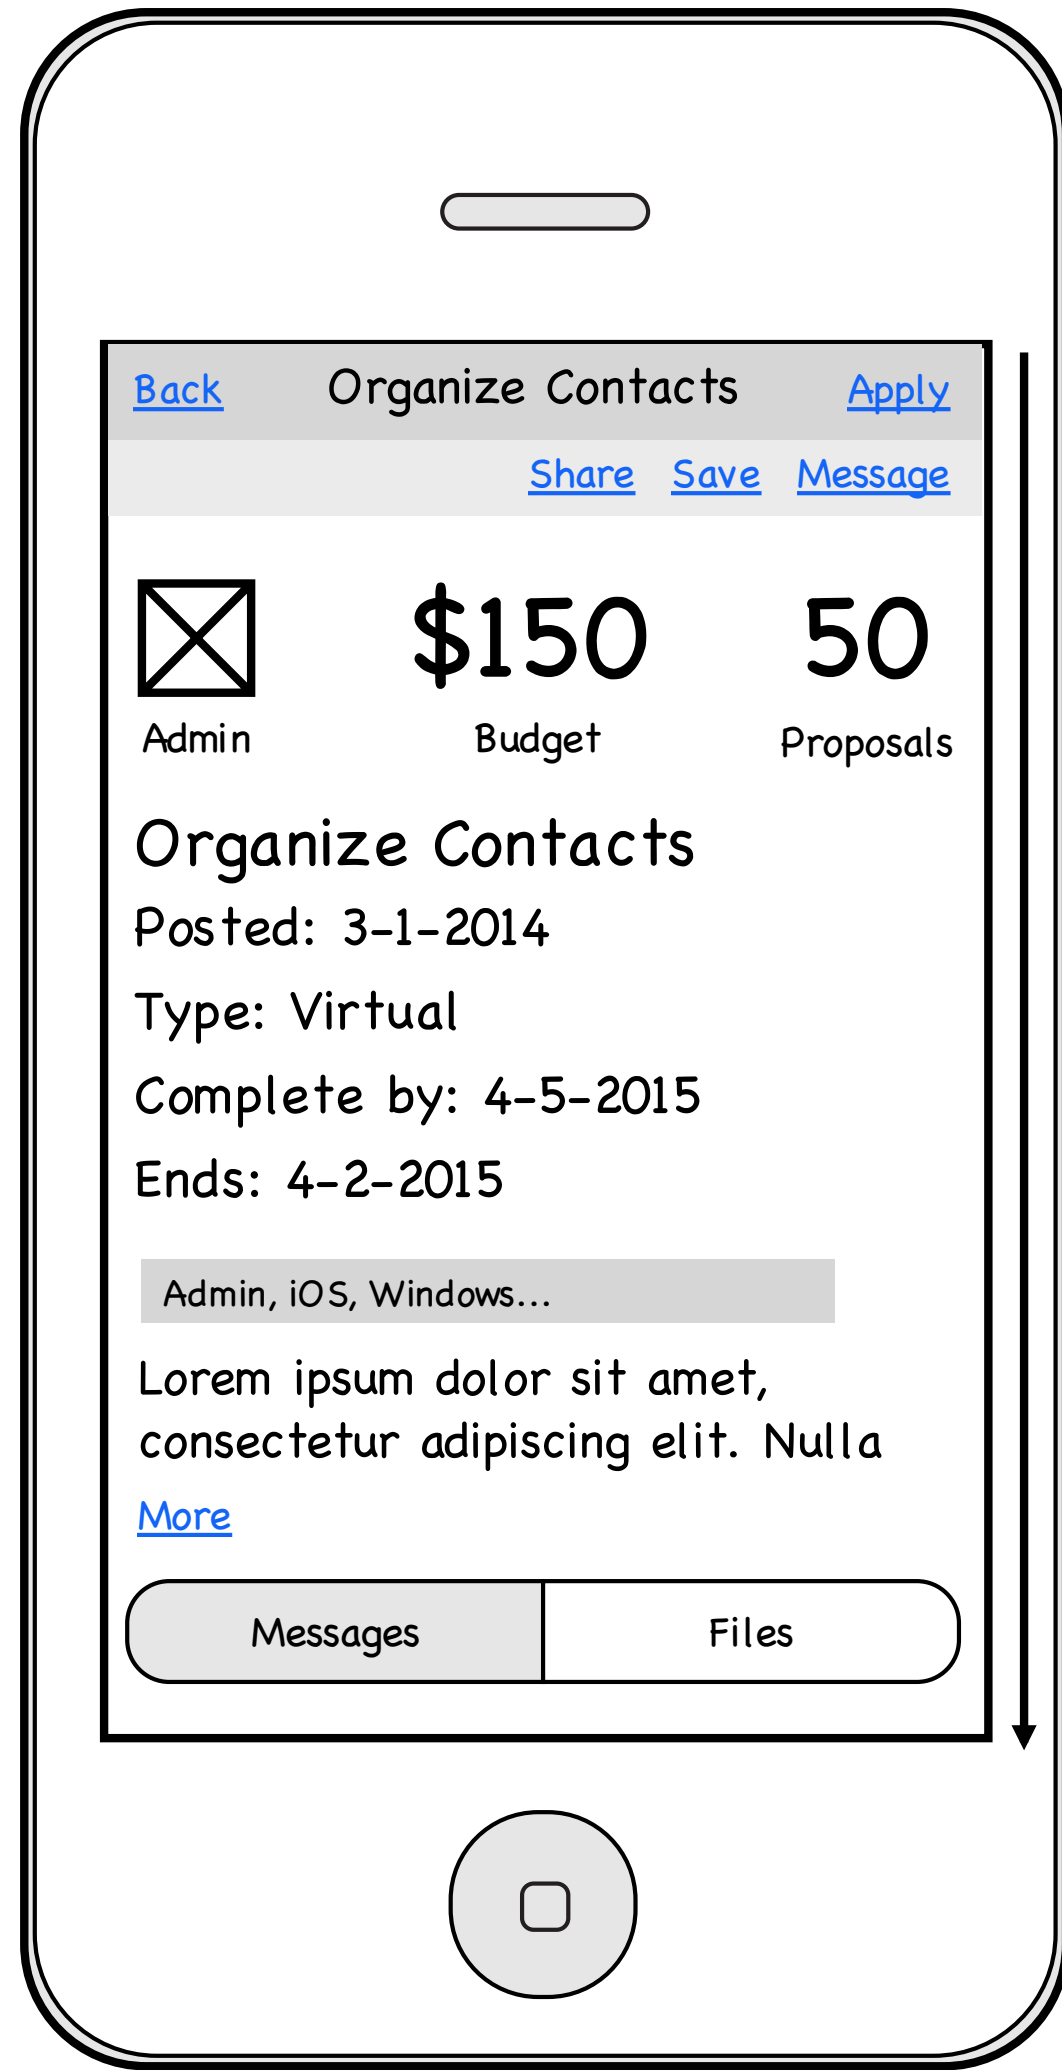

Search results screen has a good of information for each project. The three most important aspects are highlighted just like on the full card.

When tapping the ellipsis icon on the right user gets actions for projects. I think a swipe gesture here also helps as it's a common expectation within a mobile UI.

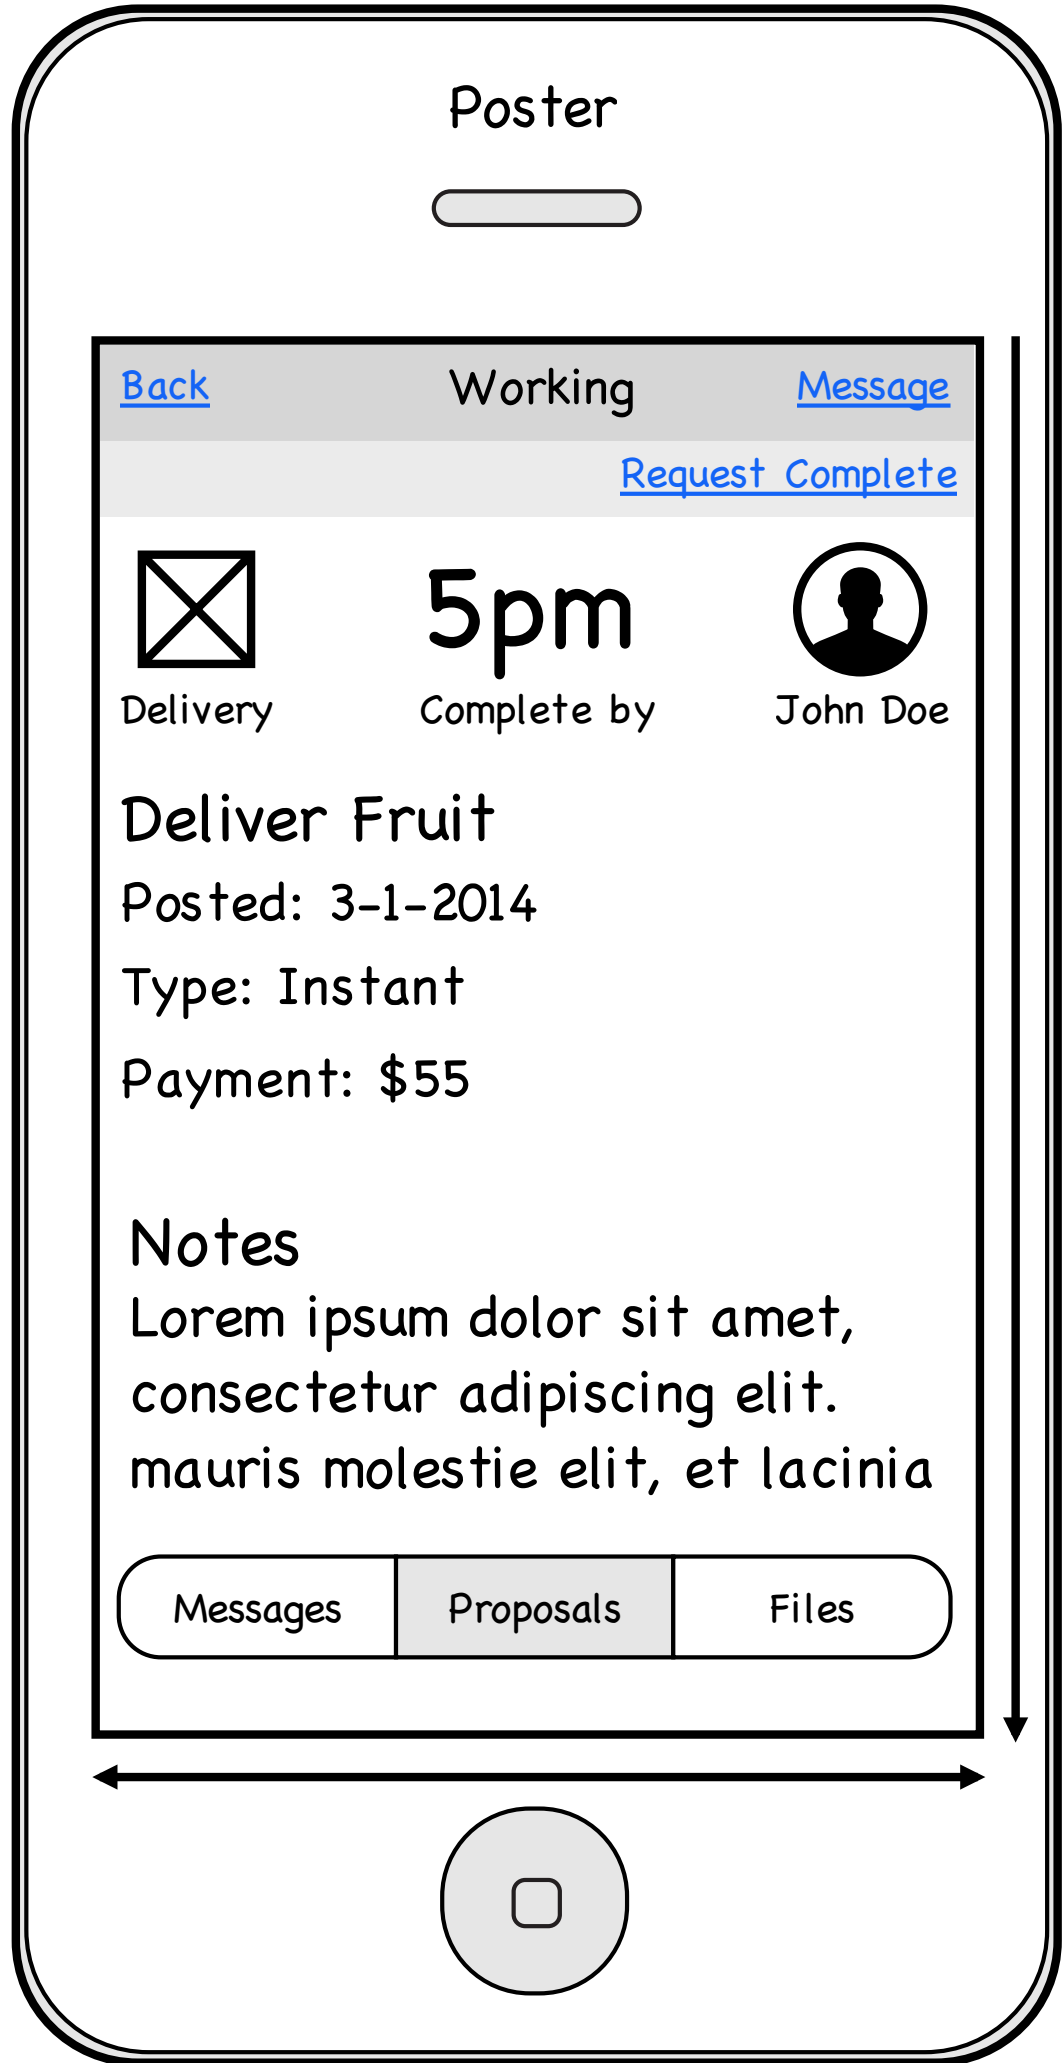

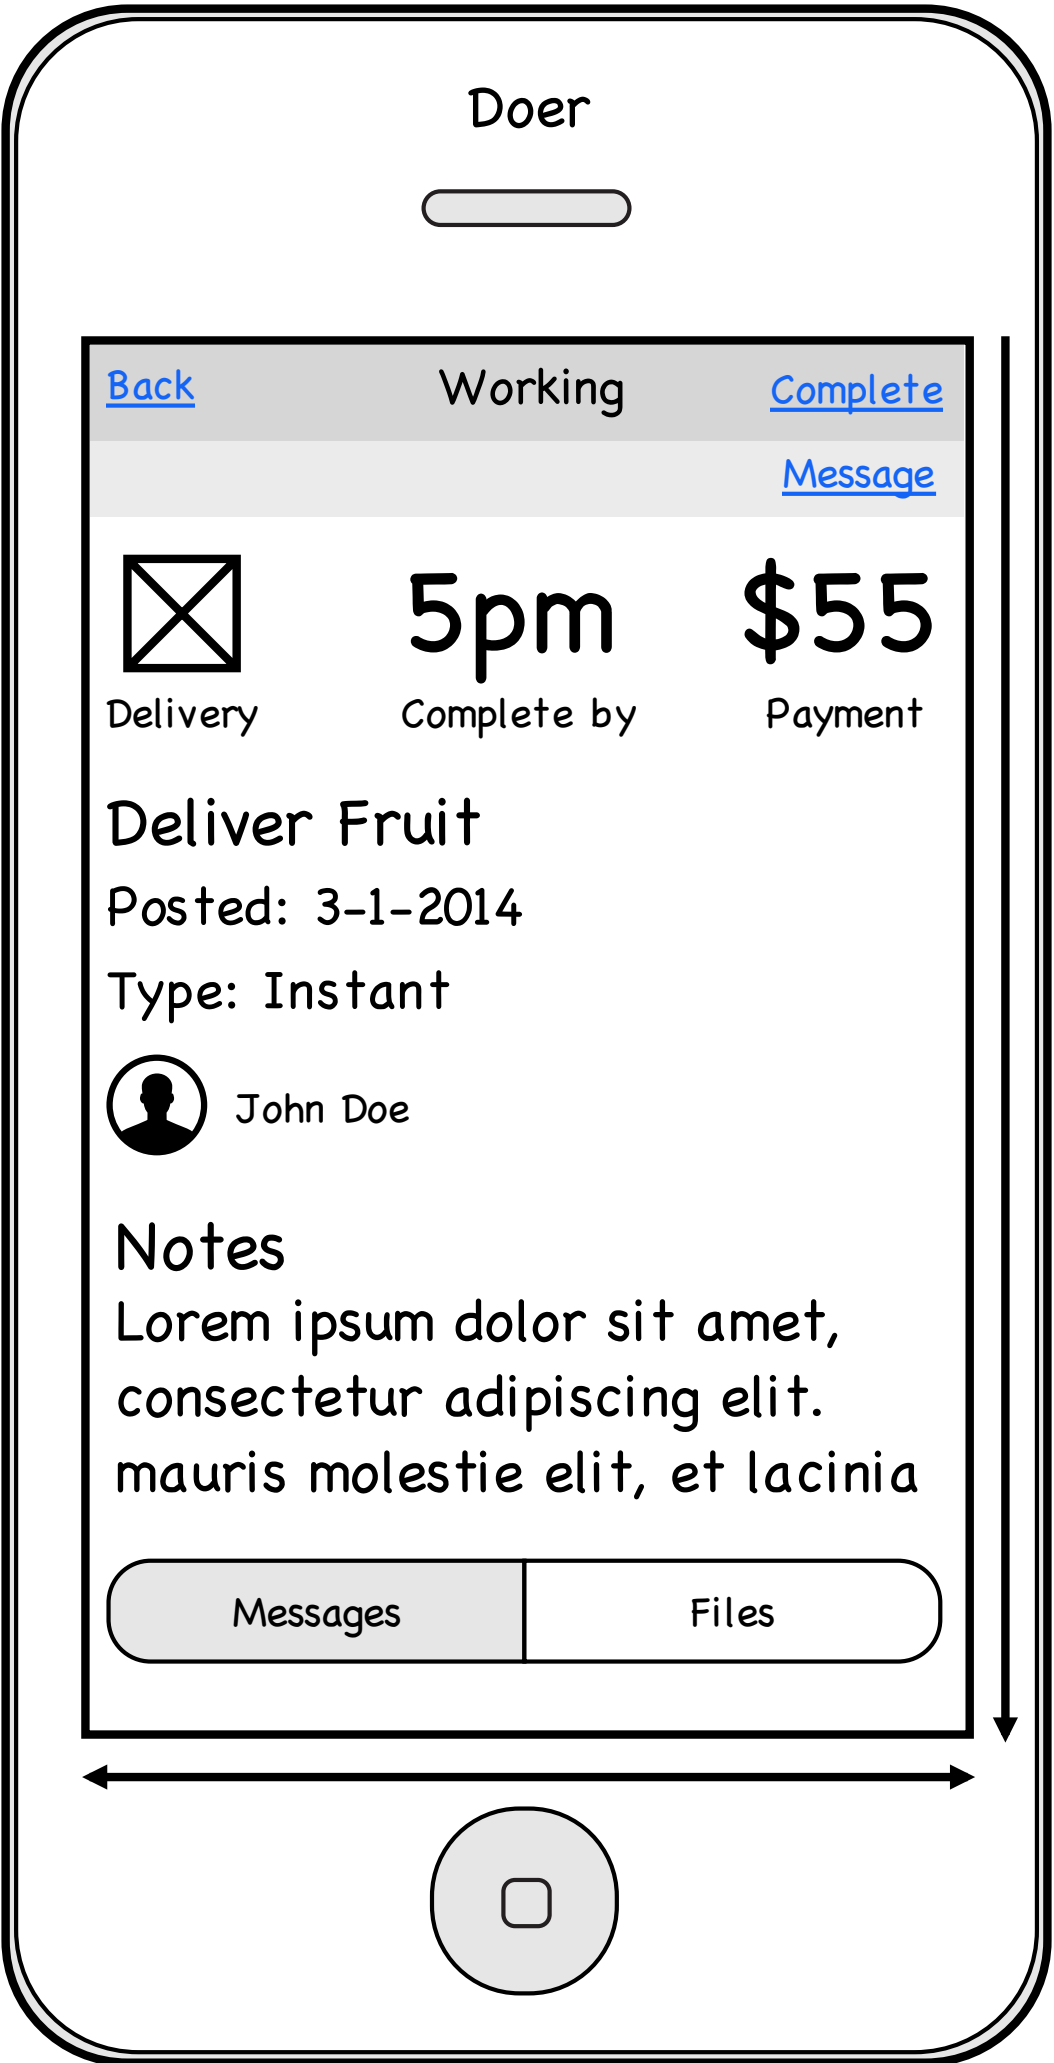

Smart filter and filters screen that slides up when tapping the filter button on the previous search screen.

Full project screen which is not too different than say a project card on the active feed. These are meant to share a lot of similarities which will making calling and linking to them easier on the back end.

Projects - Working

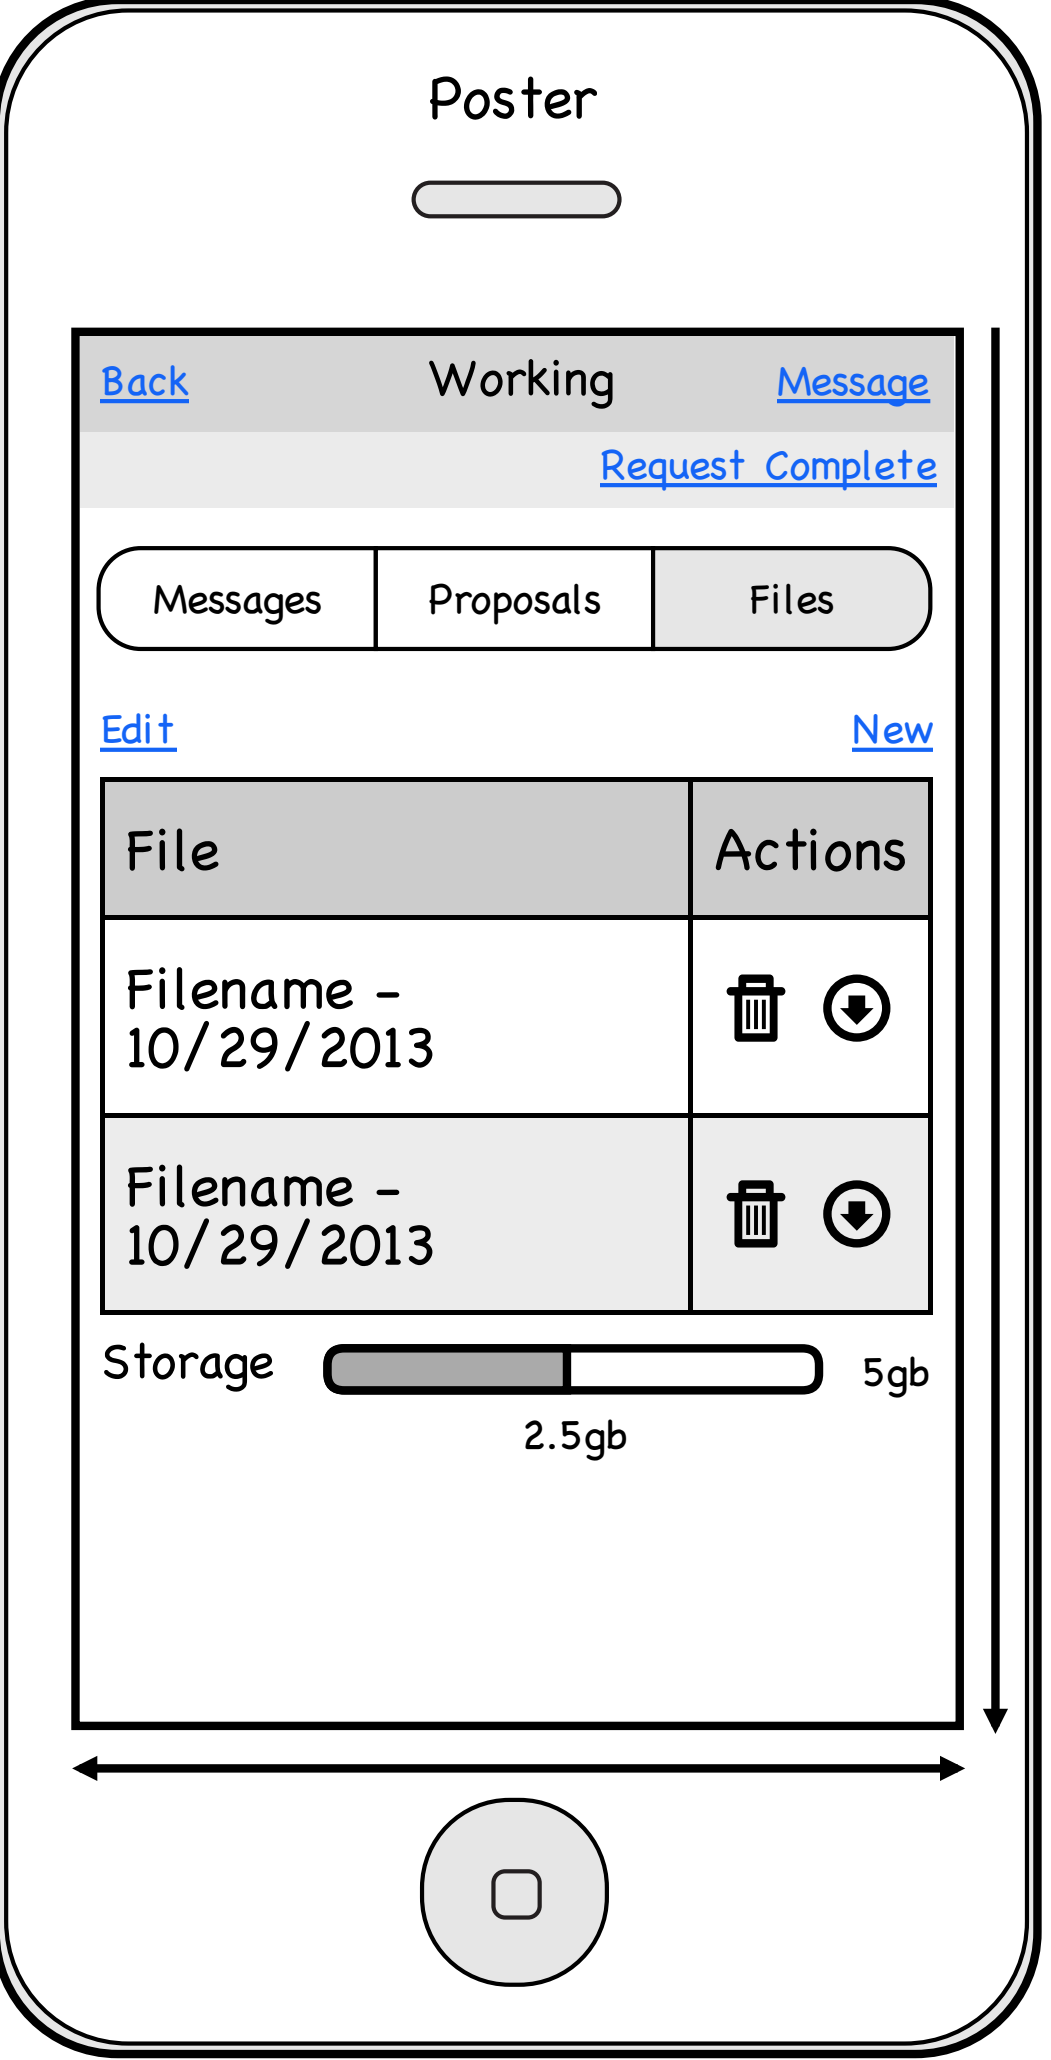

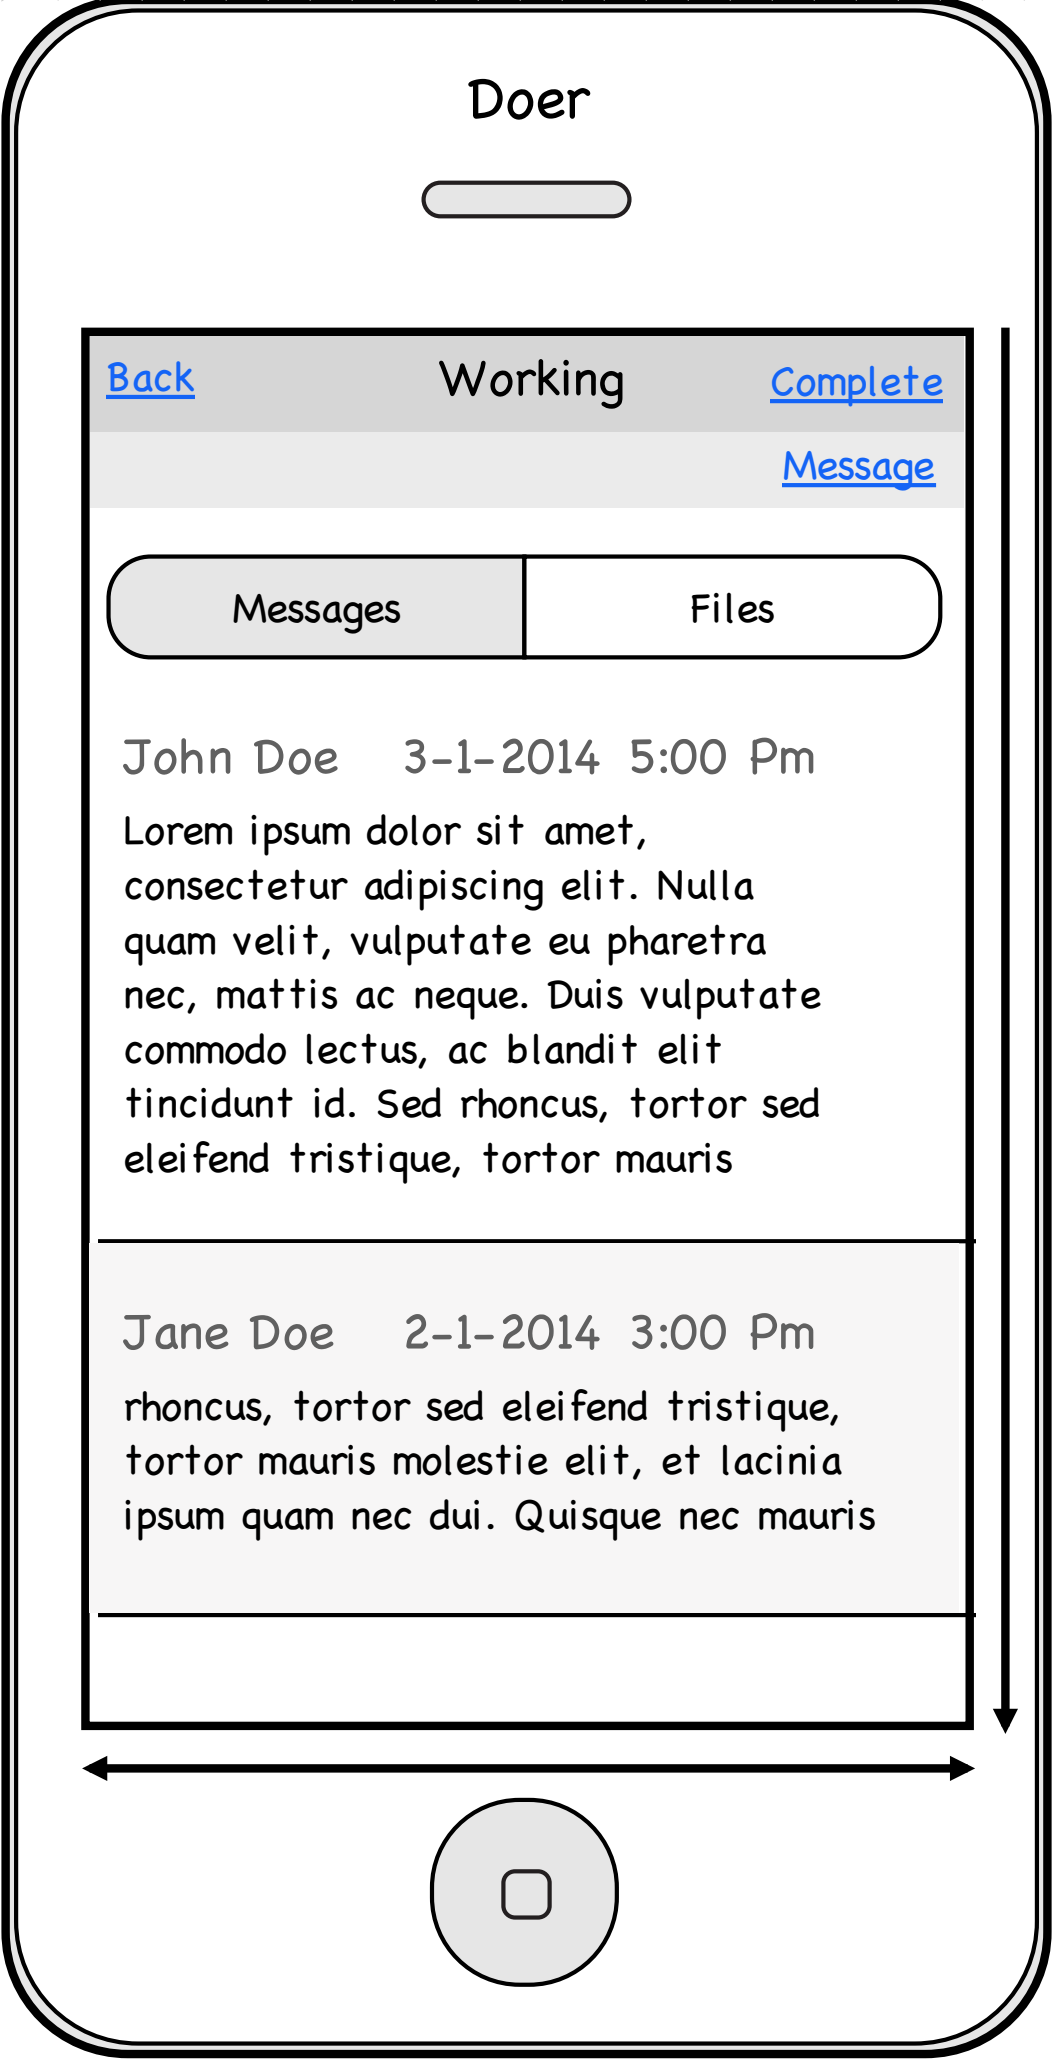

Top half of card. Second half below.

Top half of card. Scroll down to see second half

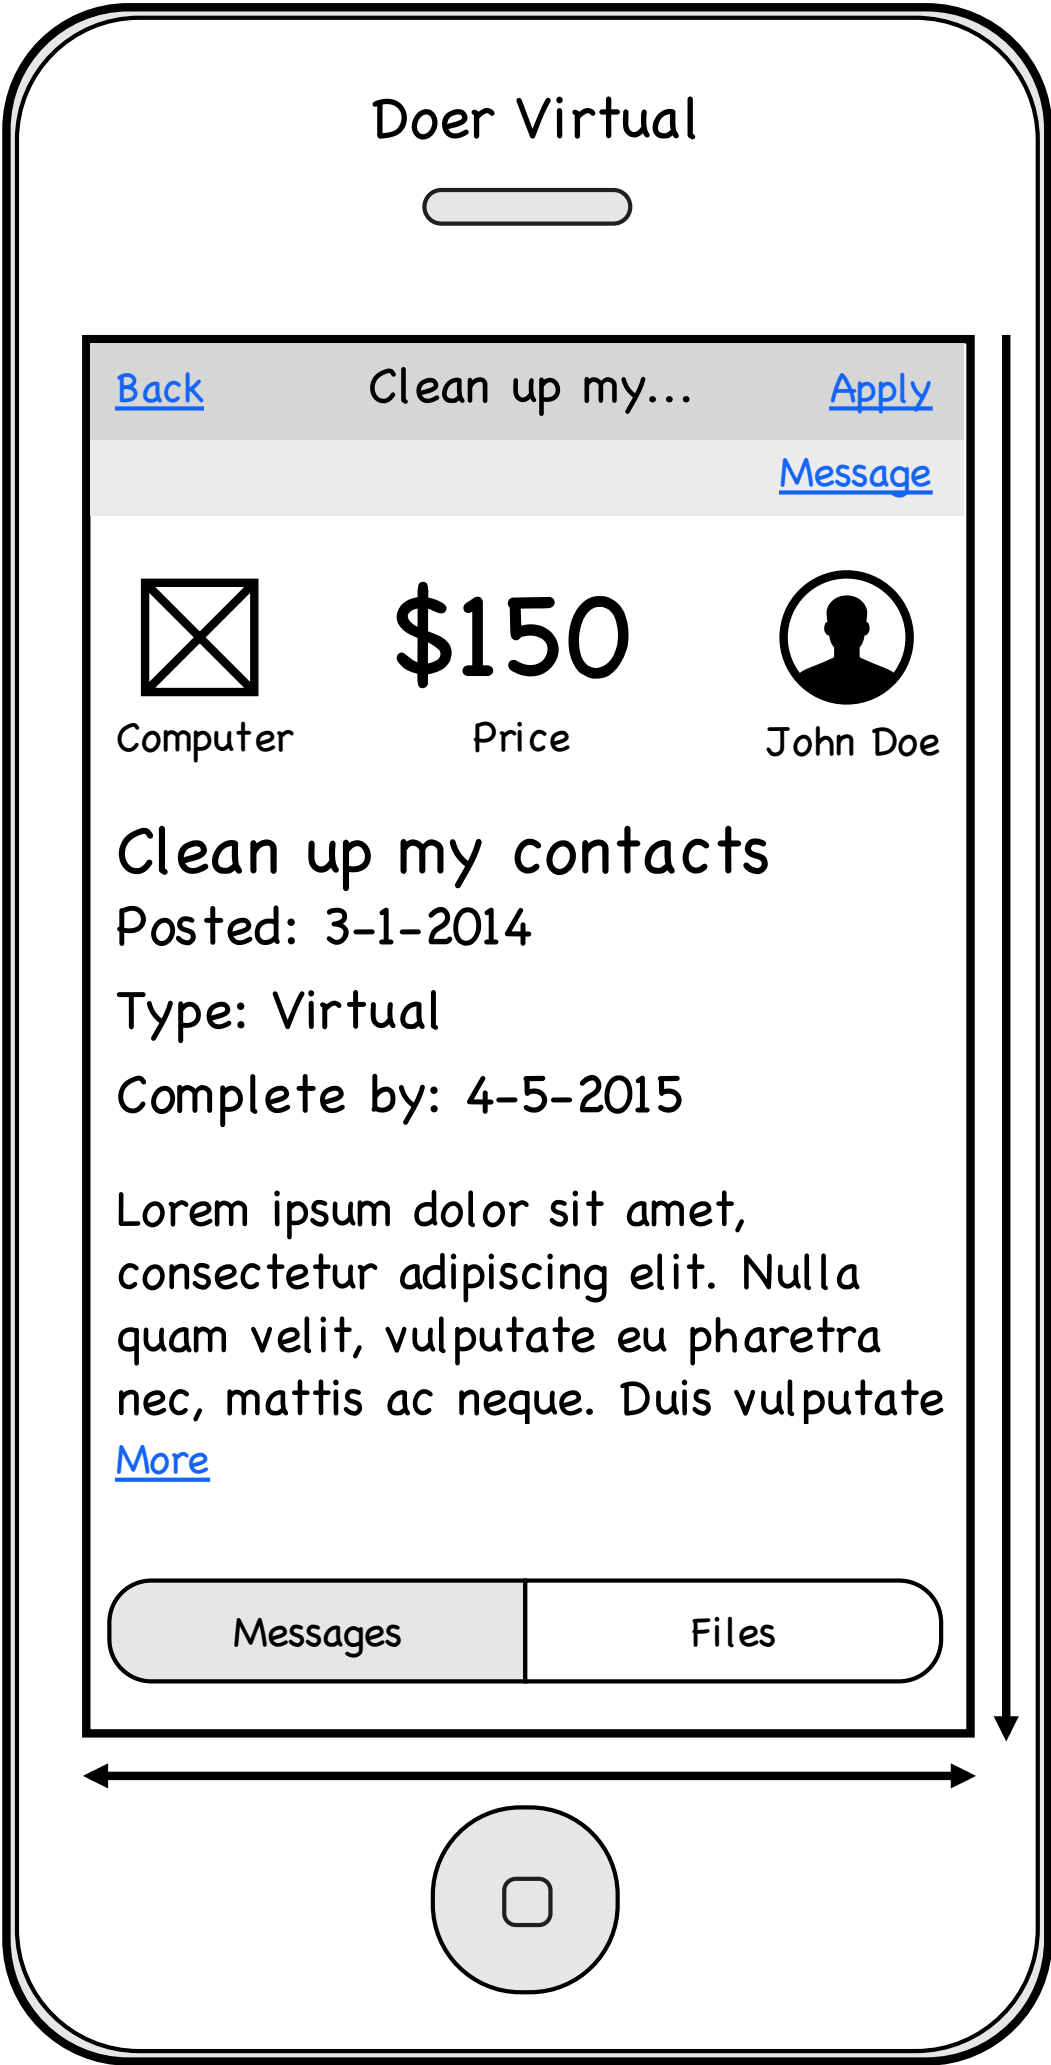

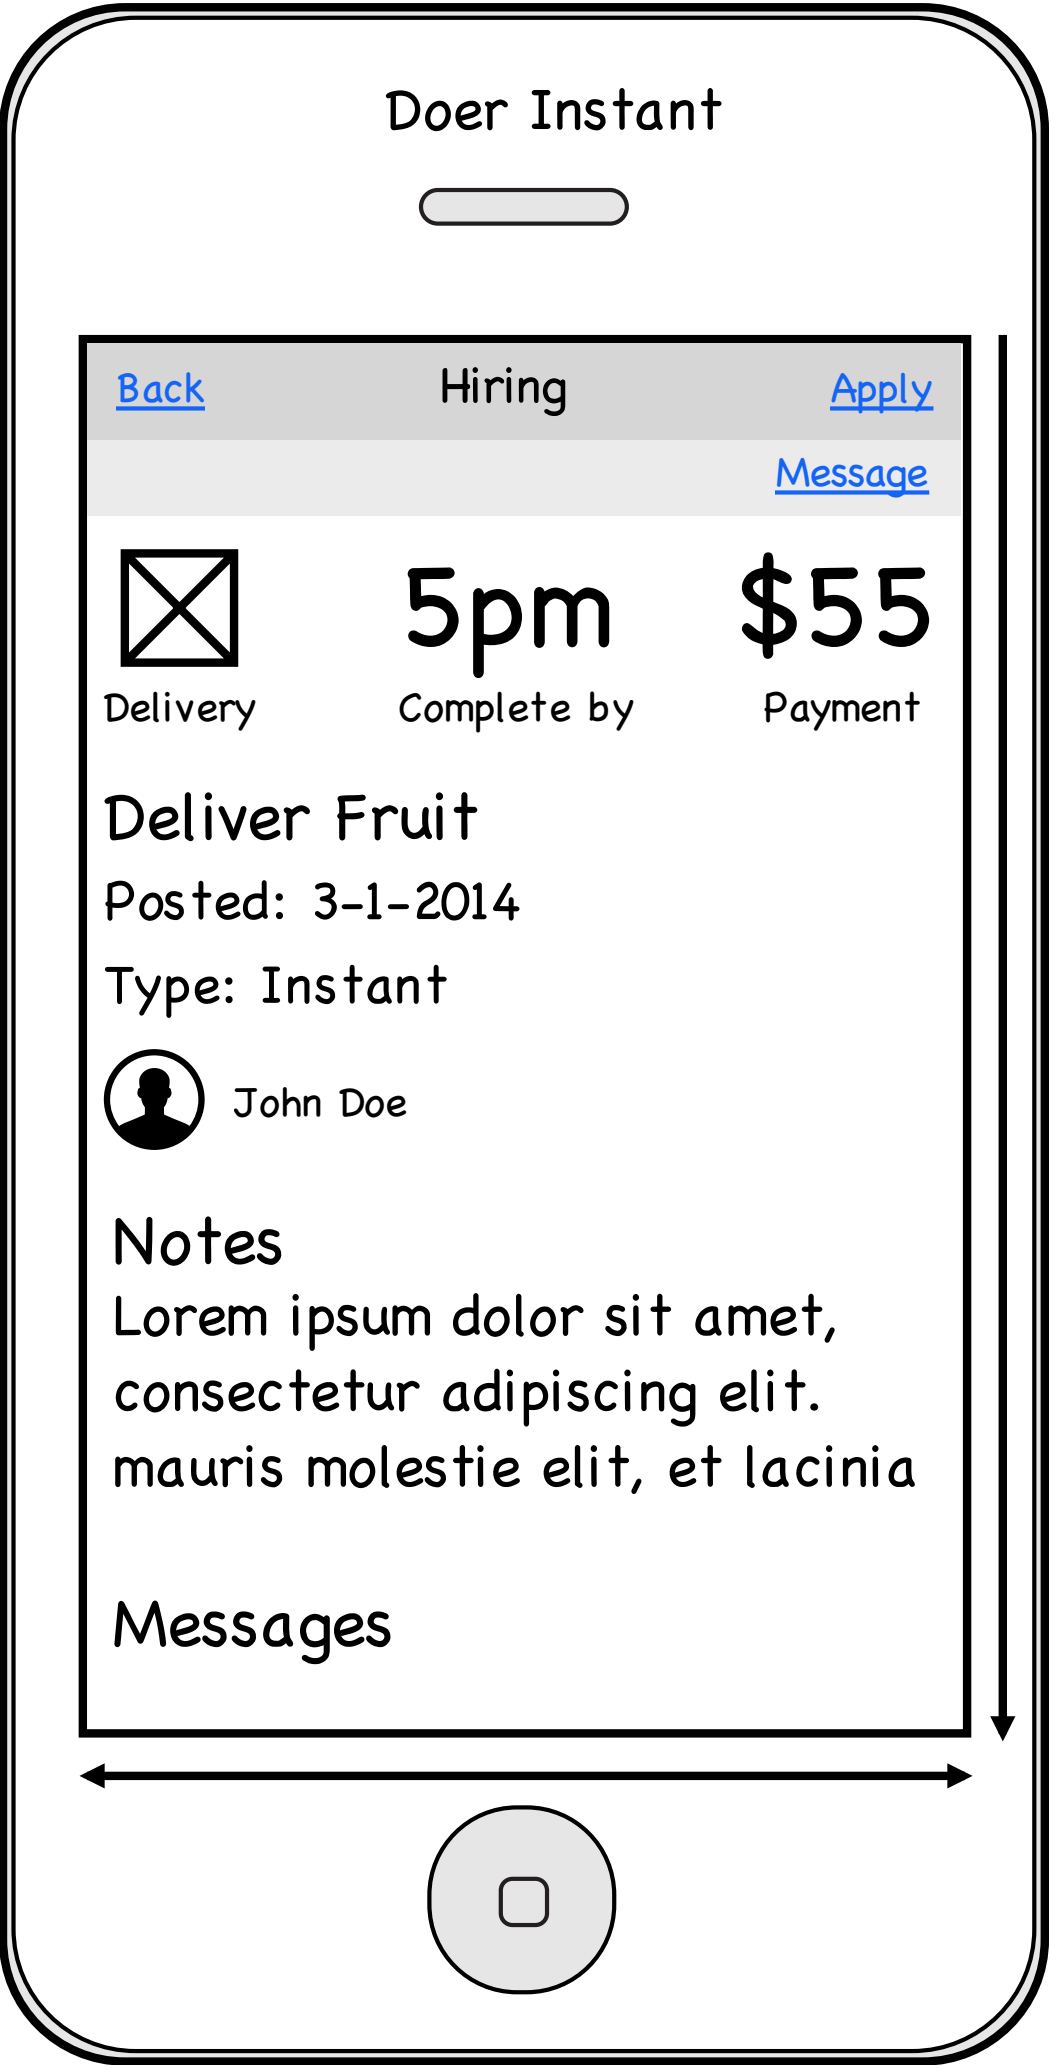

When user scrolls down they have access to the same info you would see on the site like messages and files. Doers cannot see proposals.

Proposals will display the Doers and a few basic actions. Clicking on the Doer will take the Poster to the full Doer profile.

Files will use a basic list view from the iOS framework. Poster can get the same info they see on the site.

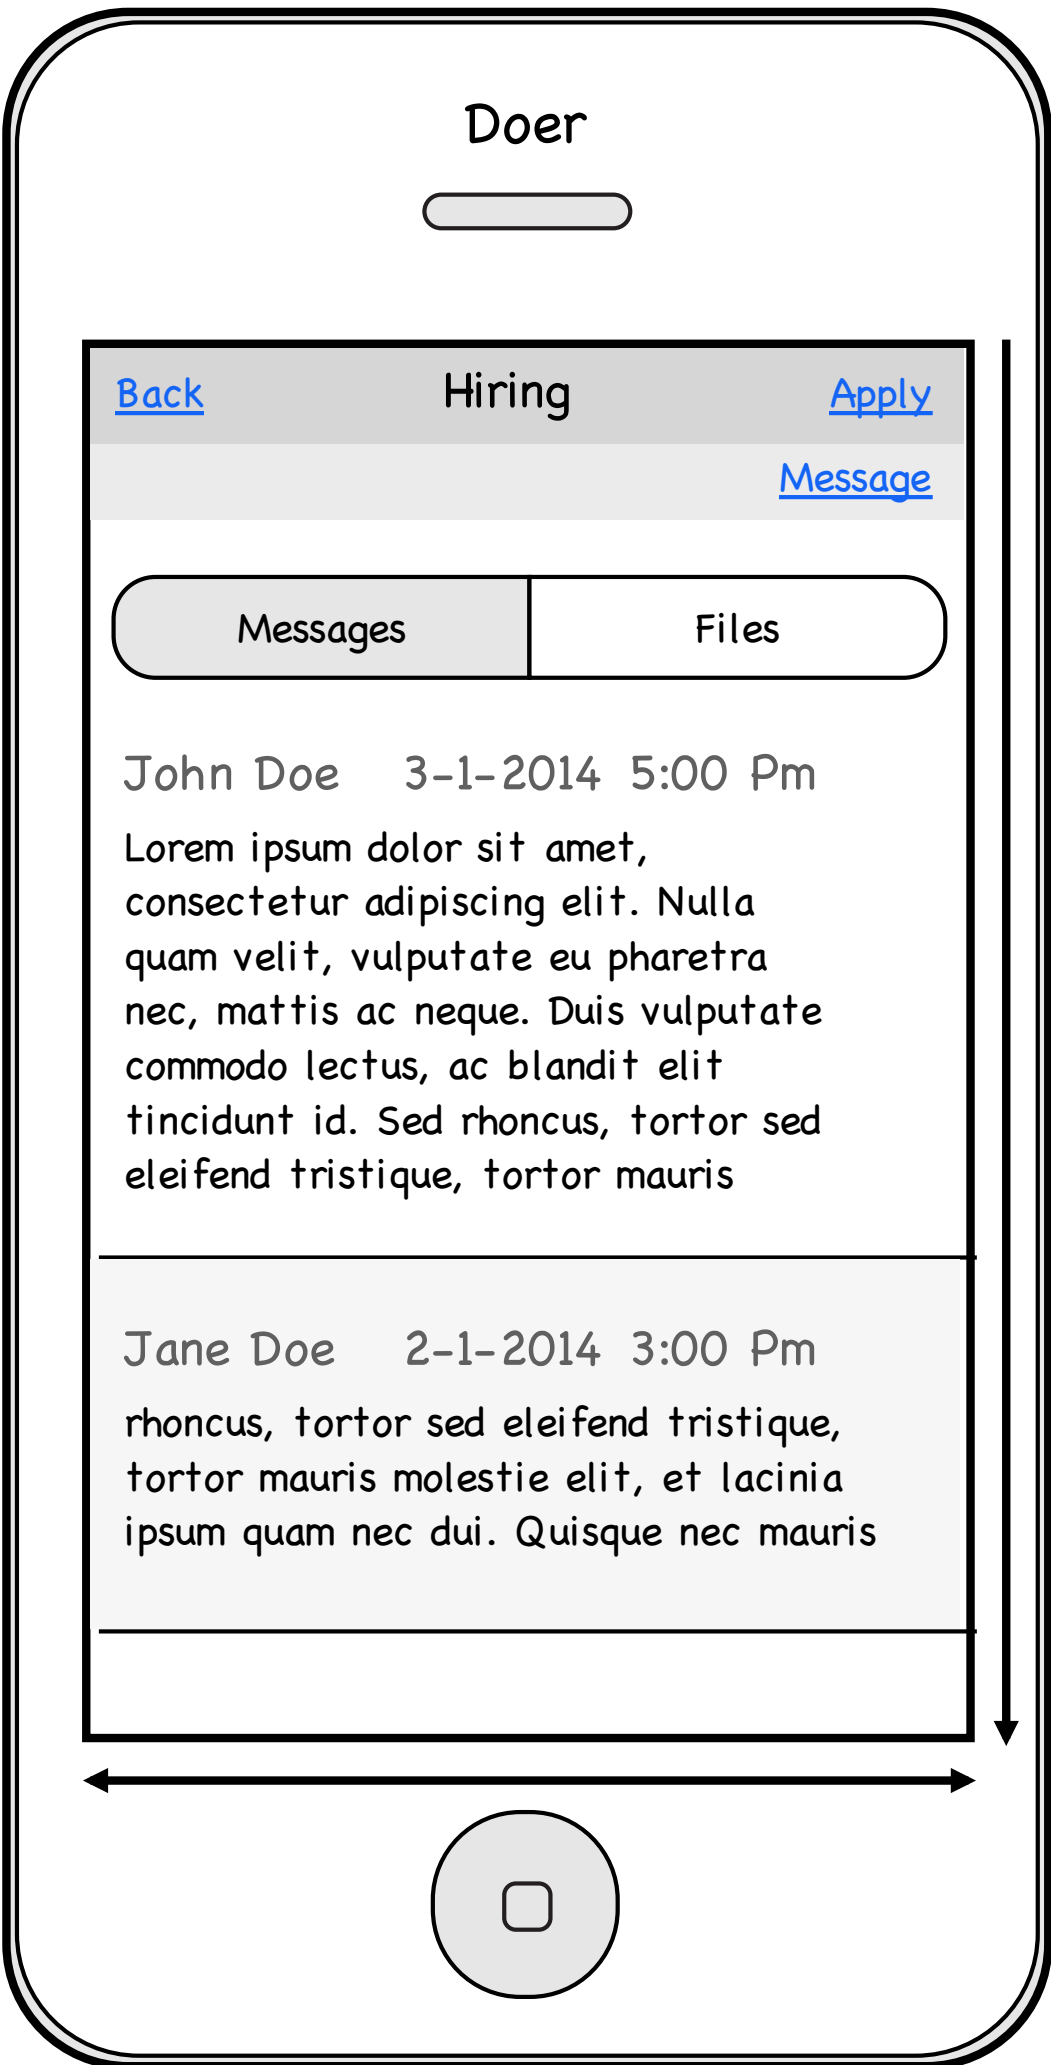

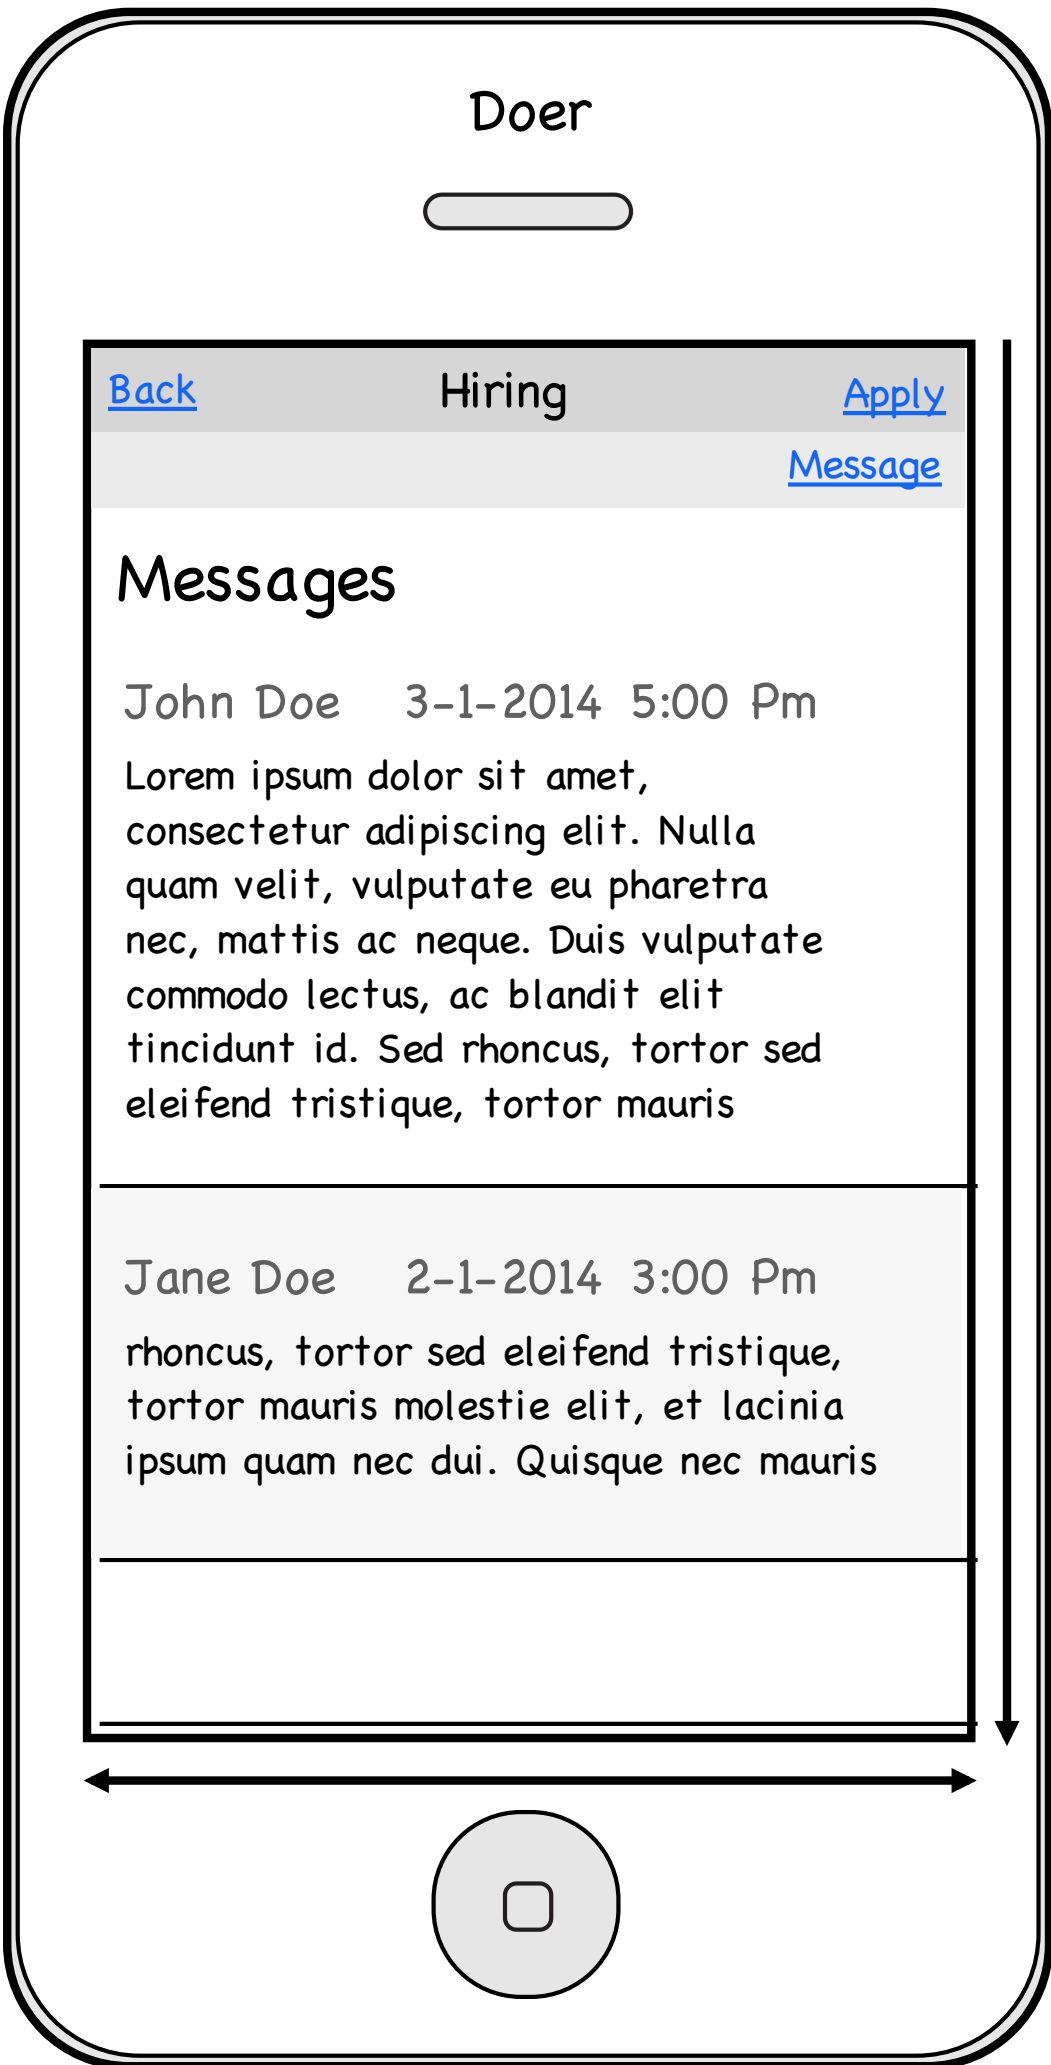

Projects - Apply - Doer

This is a hiring card that a user would see and can click on to apply to.

Virtual card which would have the addition of files etc.

Full Screen Card. A posters view. Quick view of a Doers status. These cards are very similar to the project pages on the site.
