

# Message Central

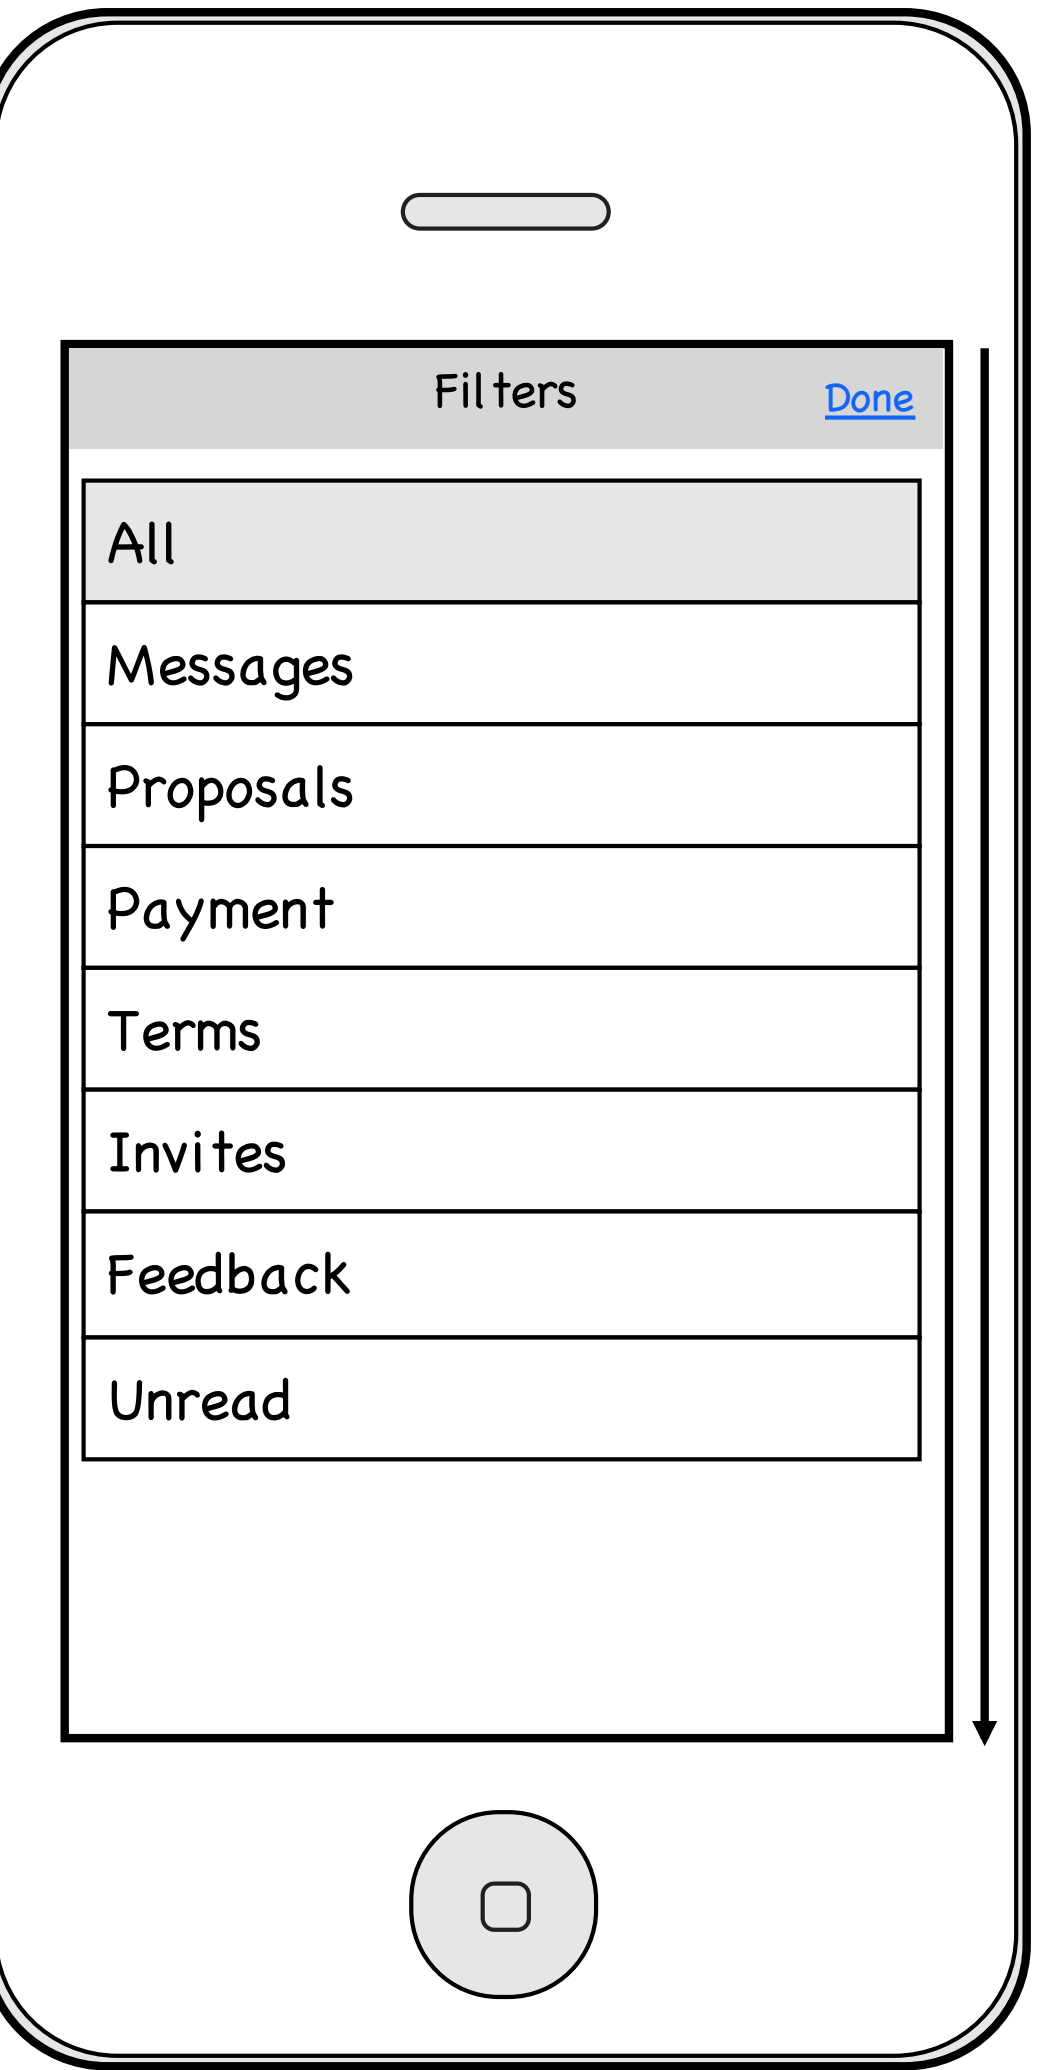

Main message screen. From here a user can search for any message and quickly get to any of the different main time based categories like we have on the site.

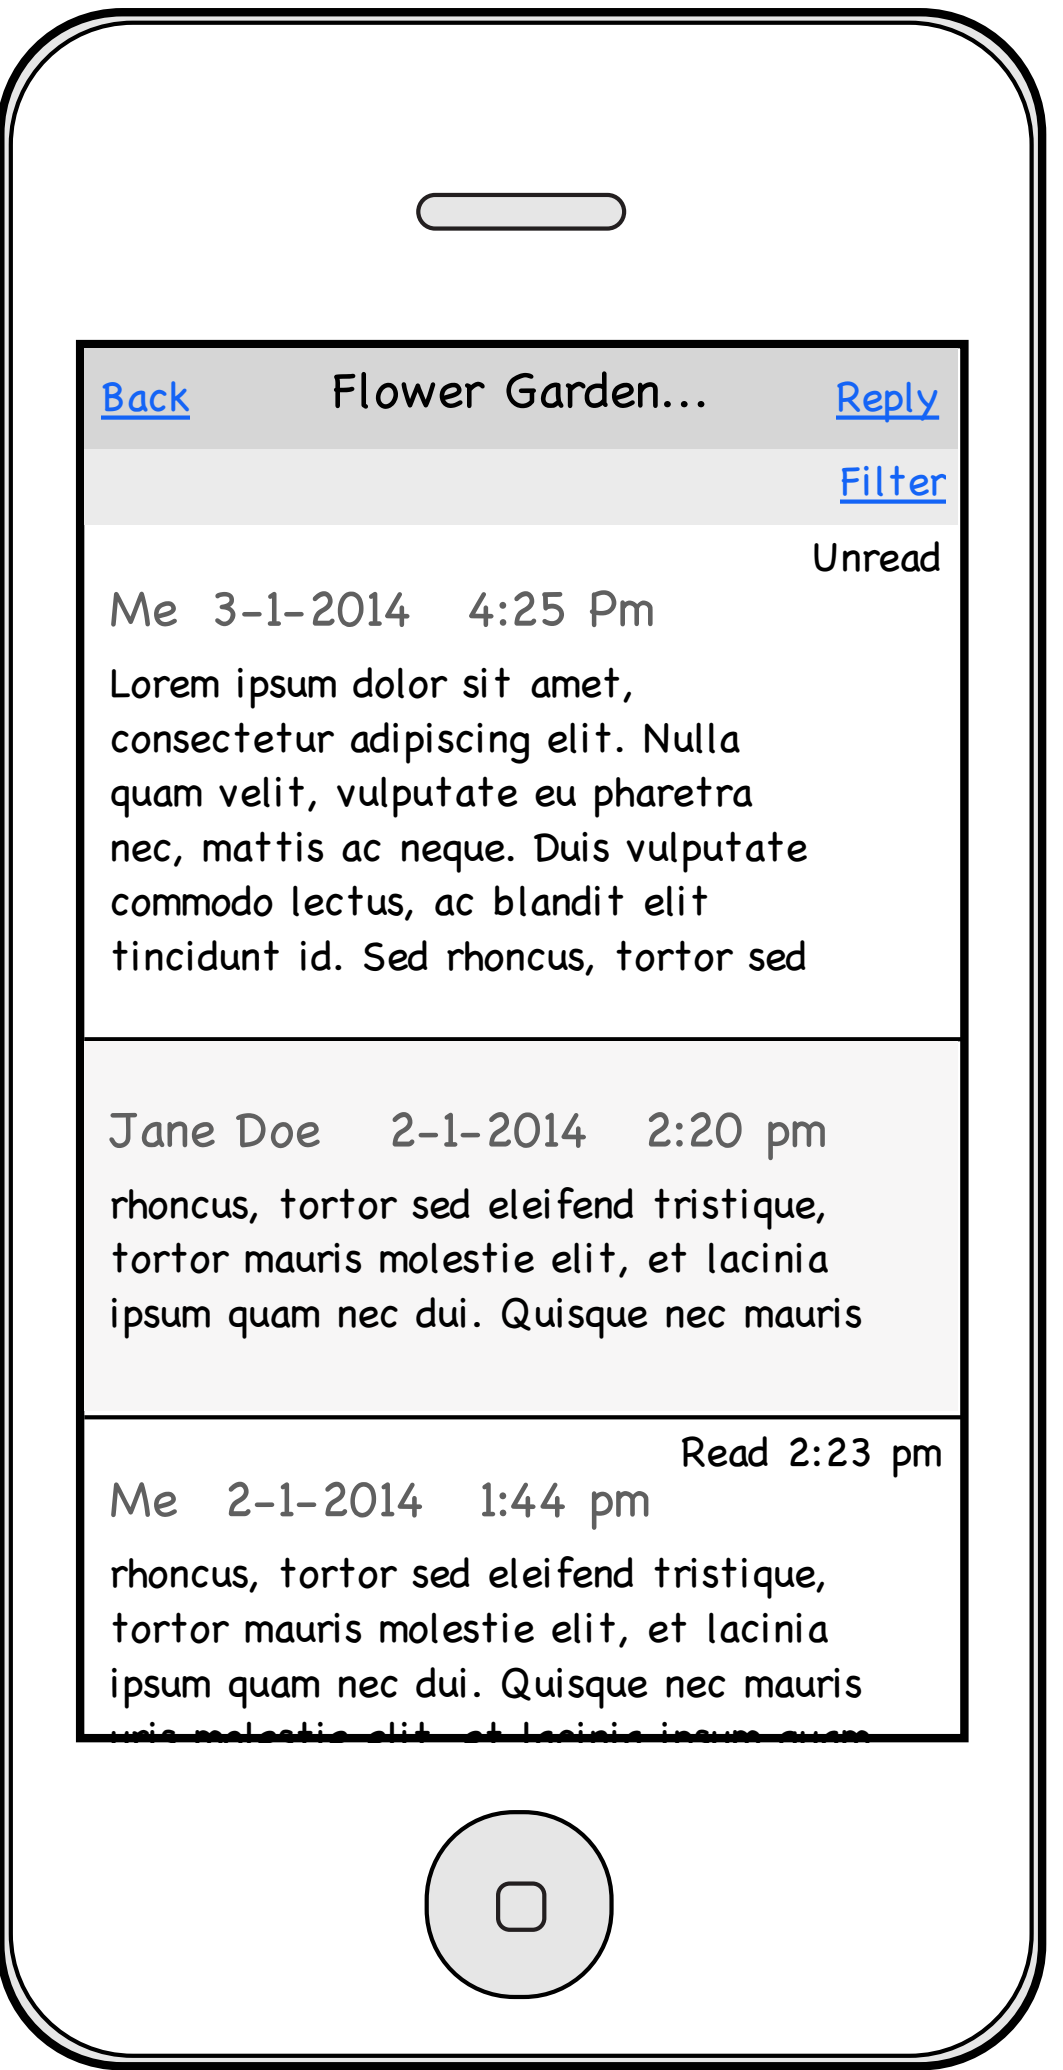

Once a category is chosen a user goes to a screen which list all the different threads. If your in the all messages section I think it would be handing to have the archived list item at the bottom just for convenience and since it's 'all messages'.

Instead of a user having to manually archive project threads it would be handy to just have them archived when a job is finished (or cancelled). But for a user to mark something unread (whatever else in the future) they can use the multiple selection method with radio buttons as seen here.

Using the filters screen a user can get to the specifics of a message. We have this on the site and I think it should be a good usability feature to have here.

A message thread should be as simple as possible. I'm using alternating row background colors to help a users eyes as they go down the thread to older messages.

I've added read/unread status messages on messages. Seems like a great way to keep people accountable and communicating.

Simple reply screen. User should be warned when tapping cancel if they've typed anything here.

Adding an attachment uses the default iOS window for allowing a user to pull files from photos or other connected apps through extensibility.
